GALLERY UNTITLED

Coralleopardus perforatus

formaat: 100 cm x 80 cm (schilderij), 114 cm x 95 cm (lijst)

techniek: zijdeglans vernis, acrylverf, zuurvrij papier (museumkwaliteit) verlijmd op dibond paneel

jaar: 2021/2026

lijst: handgemaakte houten lijst, zwevend ingelijst achter museumglas

The depicted species was discovered during Deleo's first expedition to Terra Ultima in the Gulf of Litotes.

It is unclear what comes first - the holes that make up the coral leopard, or the calcium skeleton that holds it together. However, it is already determined that a saltwater clam (the naval shipworm) causes the holes to get bigger over time.

Eventually, you can no longer see the coral leopard - you can only suspect it is there.
